As Europe faces intensifying climate hazards, such as heavy precipitation, flooding, and heatwaves, the impacts on citizens, communities, and infrastructure highlight the need to increase societal preparedness to anticipate consequences and act preemptively.

Join us online for the “Developing Early Warning Systems for Climate Resilience” event, which will focus on the critical role of early warning systems in climate adaptation planning and reducing the impact of climate-related risks. The event will introduce key strategies, tools, and governance approaches that support the design and implementation of Early Warning Systems, highlighting their vital role in protecting communities and enhancing preparedness.

Through presentations and discussions, participants will hear from local and regional actors who will share their real-world experiences, innovations, and lessons learned in developing and applying early warning systems for various climate hazards. The session will provide practical insights into how they can be tailored to specific regional vulnerabilities, turning knowledge into action for more resilient, climate-ready communities.
